It is very fair to say that Python's skills and experience can lead to a profitable and safe career. The proper Python certification can influence hiring managers who wish to fulfill specific roles in their team. “The following is an excerpt from a topic from the Coursera community forum about what the programming languages our community members use.” I have been developing software for 50 years (now retired) and languages go and come. In commercializable skills, C and C++ are essential basic skills. I used C for over 30 years. Learn Haskell, it will improve all your other programming skills, even if you never use it in a project." - Gordon "For data science, it is more important to understand and implement algorithms. Python is one of the languages that really describe themselves. And one of the main reasons why I use it for data science projects, especially machine learning, is that it is very light. Anyway, for all of my projects that have complicated algorithms, I use Octave to experiment with algorithms (since I have all the datasecure codes stored there). Mainly divulging it in simpler problems and, at the end Join the simplest and shorter algorithms. " - Hardi € Žboth Python and R are free and open source languages that can run on Windows, MacOS and Linux. Both can handle virtually any data analysis task, and both are considered relatively easy to learn languages, especially for beginners. So, what should you choose to learn (or learn first)? Before we search for the differences, here is a broad overview of each language.
